Polynomial Operations EXAM (version 208)

1. Let polynomials $p(x)$ and $q(x)$ be defined below.

$$p(x) = -2x^5 - x^3 - 7x^2 - 5x + 3$$

$$q(x) = -2x^5 + 8x^4 + 7x^3 - 5x + 9$$

Express the difference $p(x) - q(x)$ in standard form.

2. Let polynomials $a(x)$ and $b(x)$ be defined below.

$$a(x) = 6x^2 - 9x - 5$$

$$b(x) = 5x + 4$$

Express the product $a(x) \cdot b(x)$ in standard form.

3. Express $(x + 1)^4$ in standard (expanded) form.

Polynomial Operations EXAM (version 208)

4. Let polynomials $f(x)$ and $g(x)$ be defined below.

$$\begin{aligned}f(x) &= 3x^3 + 16x^2 + 8x + 21 \\g(x) &= x + 5\end{aligned}$$

The quotient of $\frac{f(x)}{g(x)}$ can be expressed as a polynomial, $h(x)$, and a remainder, R (a real number).

$$\frac{f(x)}{g(x)} = h(x) + \frac{R}{x + 5}$$

By using synthetic division or long division, express $h(x)$ in standard form, and find the remainder R .

5. Let polynomial $f(x)$ still be defined as $f(x) = 3x^3 + 16x^2 + 8x + 21$. Evaluate $f(-5)$.
