

1. Each of the curves below represent a different  $y = f(x)$ . For each, draw a second curve,  $y = g(x)$ , defined by the equation above the graph.

$$g(x) = f(2x) + 2$$

$$g(x) = 2 \cdot f(x - 2)$$

$$g(x) = 2 \cdot f\left(\frac{x}{2}\right)$$

$$g(x) = f(x - 2) - 2$$

2. On each graph below, curve  $y = f(x)$  is shown as a dashed line with open dots at key points, and curve  $y = g(x)$  is shown as a solid line with closed dots at key points. For each, write an equation that defines  $g(x)$  as a transformation of  $f(x)$ .

Eq:  $g(x) = 2 \cdot f(x+2)$

Eq:  $g(x) = f(x+2) + 2$

Eq:  $g(x) = 2 \cdot f(2x)$

Eq:  $g(x) = f(x-2) + 2$
