Polynomial Operations EXAM (version 114)

1. Let polynomials $p(x)$ and $q(x)$ be defined below.

$$p(x) = x^5 + 3x^4 - 5x^2 - 7x - 8$$

$$q(x) = -10x^5 + 6x^4 - 2x^3 + 5x^2 + 1$$

Express the difference $q(x) - p(x)$ in standard form.

2. Let polynomials $a(x)$ and $b(x)$ be defined below.

$$a(x) = -2x^2 - 4x + 3$$

$$b(x) = -4x - 2$$

Express the product $a(x) \cdot b(x)$ in standard form.

3. Express $(x + 1)^6$ in standard (expanded) form.

Polynomial Operations EXAM (version 114)

4. Let polynomials $f(x)$ and $g(x)$ be defined below.

$$\begin{aligned}f(x) &= -4x^3 + 28x^2 + 3x - 11 \\g(x) &= x - 7\end{aligned}$$

The quotient of $\frac{f(x)}{g(x)}$ can be expressed as a polynomial, $h(x)$, and a remainder, R (a real number).

$$\frac{f(x)}{g(x)} = h(x) + \frac{R}{x - 7}$$

By using synthetic division or long division, express $h(x)$ in standard form, and find the remainder R .

5. Let polynomial $f(x)$ still be defined as $f(x) = -4x^3 + 28x^2 + 3x - 11$. Evaluate $f(7)$.
