## Polynomial Operations EXAM (version 219)

1. Let polynomials  $p(x)$  and  $q(x)$  be defined below.

$$p(x) = 7x^5 + 2x^3 - 10x^2 - 6x + 3$$

$$q(x) = -8x^5 + 2x^4 + 4x^2 - x + 7$$

Express the difference  $q(x) - p(x)$  in standard form.

2. Let polynomials  $a(x)$  and  $b(x)$  be defined below.

$$a(x) = -2x^2 + 4x - 9$$

$$b(x) = 5x - 4$$

Express the product  $a(x) \cdot b(x)$  in standard form.

3. Express  $(x + 1)^5$  in standard (expanded) form.

## Polynomial Operations EXAM (version 219)

4. Let polynomials  $f(x)$  and  $g(x)$  be defined below.

$$\begin{aligned}f(x) &= 2x^3 + 19x^2 + 21x - 20 \\g(x) &= x + 8\end{aligned}$$

The quotient of  $\frac{f(x)}{g(x)}$  can be expressed as a polynomial,  $h(x)$ , and a remainder,  $R$  (a real number).

$$\frac{f(x)}{g(x)} = h(x) + \frac{R}{x + 8}$$

By using synthetic division or long division, express  $h(x)$  in standard form, and find the remainder  $R$ .

5. Let polynomial  $f(x)$  still be defined as  $f(x) = 2x^3 + 19x^2 + 21x - 20$ . Evaluate  $f(-8)$ .
