Trig Final (SLTN v658)

- You should have a calculator (like [Desmos](#)) and a [unit-circle](#) reference sheet.

Question 1

In the figure below, we see a circle and a central angle that subtends an arc. The arc length is 16 meters. The radius is 10 meters. What is the angle measure in radians?

$$\theta = \frac{L}{r} \quad r = \frac{L}{\theta} \quad L = r\theta$$

$\theta = 1.6$ radians.

Question 2

Consider angles $-\frac{11\pi}{4}$ and $\frac{8\pi}{3}$. For each angle, use a spiral with an arrow head to **mark** the angle on a circle below in standard position. Then, find **exact** expressions for $\cos\left(-\frac{11\pi}{4}\right)$ and $\sin\left(\frac{8\pi}{3}\right)$ by using a unit circle (provided separately).

Find $\cos(-11\pi/4)$

$$\cos(-11\pi/4) = \frac{-\sqrt{2}}{2}$$

Find $\sin(8\pi/3)$

$$\sin(8\pi/3) = \frac{\sqrt{3}}{2}$$

Question 3

If $\tan(\theta) = \frac{-63}{16}$, and θ is in quadrant IV, determine an exact value for $\cos(\theta)$.

Ignore any negatives and the quadrant, and draw a right triangle (based on SOHCAHTOA) in standard (quadrant I) orientation.

Solve the Pythagorean Equation

$$\begin{aligned}16^2 + 63^2 &= C^2 \\ C &= \sqrt{16^2 + 63^2} \\ C &= 65\end{aligned}$$

Rescale the triangle so the hypotenuse is 1. Reflect the triangle into Quadrant IV in a unit circle.

$$\cos(\theta) = \frac{16}{65}$$

Question 4

A mass-spring system oscillates vertically with a midline at $y = 2.87$ meters, a frequency of 5.1 Hz, and an amplitude of 6.93 meters. At $t = 0$, the mass is at the midline and moving up. Write an equation to model the height (y in meters) as a function of time (t in seconds).

Any of these equations would get full credit.

$$y = 6.93 \sin(2\pi 5.1t) + 2.87$$

or

$$y = 6.93 \sin(10.2\pi t) + 2.87$$

or

$$y = 6.93 \sin(32.04t) + 2.87$$
