Polynomial Operations EXAM (version 235)

1. Let polynomials $p(x)$ and $q(x)$ be defined below.

$$p(x) = -5x^5 + 6x^4 + x^2 + 10x + 7$$

$$q(x) = 3x^5 - 5x^3 - 6x^2 + 8x - 4$$

Express the sum of $p(x) + q(x)$ in standard form.

2. Let polynomials $a(x)$ and $b(x)$ be defined below.

$$a(x) = -6x^2 + 3x + 2$$

$$b(x) = 9x - 5$$

Express the product $a(x) \cdot b(x)$ in standard form.

3. Express $(x + 1)^4$ in standard (expanded) form.

Polynomial Operations EXAM (version 235)

4. Let polynomials $f(x)$ and $g(x)$ be defined below.

$$\begin{aligned}f(x) &= 3x^3 + 15x^2 + 20x + 27 \\g(x) &= x + 4\end{aligned}$$

The quotient of $\frac{f(x)}{g(x)}$ can be expressed as a polynomial, $h(x)$, and a remainder, R (a real number).

$$\frac{f(x)}{g(x)} = h(x) + \frac{R}{x + 4}$$

By using synthetic division or long division, express $h(x)$ in standard form, and find the remainder R .

5. Let polynomial $f(x)$ still be defined as $f(x) = 3x^3 + 15x^2 + 20x + 27$. Evaluate $f(-4)$.
