## Polynomial Operations EXAM (version 237)

1. Let polynomials  $p(x)$  and  $q(x)$  be defined below.

$$p(x) = -10x^5 - 5x^3 + 2x^2 - 3x + 6$$

$$q(x) = 6x^5 - 5x^4 - 3x^2 - 7x - 8$$

Express the sum of  $p(x) + q(x)$  in standard form.

2. Let polynomials  $a(x)$  and  $b(x)$  be defined below.

$$a(x) = 5x^2 + 3x + 6$$

$$b(x) = -2x - 5$$

Express the product  $a(x) \cdot b(x)$  in standard form.

3. Express  $(x + 1)^4$  in standard (expanded) form.

## Polynomial Operations EXAM (version 237)

4. Let polynomials  $f(x)$  and  $g(x)$  be defined below.

$$\begin{aligned}f(x) &= 2x^3 + 11x^2 - 16x + 29 \\g(x) &= x + 7\end{aligned}$$

The quotient of  $\frac{f(x)}{g(x)}$  can be expressed as a polynomial,  $h(x)$ , and a remainder,  $R$  (a real number).

$$\frac{f(x)}{g(x)} = h(x) + \frac{R}{x + 7}$$

By using synthetic division or long division, express  $h(x)$  in standard form, and find the remainder  $R$ .

5. Let polynomial  $f(x)$  still be defined as  $f(x) = 2x^3 + 11x^2 - 16x + 29$ . Evaluate  $f(-7)$ .
