## s17 Geometric Series Exam (SLTN v301)

### Question 1

Consider the partial geometric series represented below with first term  $a = 360$ , common ratio  $r = \left(\frac{2}{3}\right)^{1/10}$ , and  $n = 10$  terms.

$$S = 360 + 345.7 + 331.96 + 318.77 + 306.1 + 293.94 + 282.26 + 271.04 + 260.27 + 249.93$$

We can multiply both sides by  $r$ .

$$rS = 345.7 + 331.96 + 318.77 + 306.1 + 293.94 + 282.26 + 271.04 + 260.27 + 249.93 + 240$$

What is the value of  $S - rS$ ?

Most terms cancel.

$$360 - 240 = 120$$

### Question 2

Consider the geometric series shown below, using ellipsis notation to indicate a continuation of the pattern without writing every term.

$$S = 2 + 2(6) + 2(6)^2 + 2(6)^3 + \cdots + 2(6)^{92} + 2(6)^{93} + 2(6)^{94} + 2(6)^{95}$$

Identify the initial term, the common ratio, and the number of terms.

$$\text{first term} = a = 2$$

$$\text{common ratio} = r = 6$$

$$\text{number of terms} = n = 96$$

### Question 3

Write a proof for the partial geometric series formula.

- Define the variables.
- Write the sum using variables and ellipsis notation. You can implicitly assume the number of terms is more than the number of terms you choose to write.
- Using annotated algebraic manipulation, produce the partial geometric series formula.

### Definitions

$a$  = first term

$r$  = common ratio

$n$  = number of terms

$S$  = sum of partial geometric series

The partial geometric series is expressed using ellipsis notation.

$$S = a + ar + ar^2 + ar^3 + \cdots + ar^{n-4} + ar^{n-3} + ar^{n-2} + ar^{n-1}$$

Multiply both sides by  $r$ .

$$rS = ar + ar^2 + ar^3 + ar^4 + \cdots + ar^{n-3} + ar^{n-2} + ar^{n-1} + ar^n$$

Subtract the second equation from the first equation.

$$S - rS = a - ar^n$$

Factor out  $S$  from left side.

$$S(1 - r) = a - ar^n$$

Divide both sides by  $(1 - r)$ . We technically need to enforce  $r \neq 1$  as a condition of the formula because otherwise we'd be dividing by 0 in this step, and division by 0 is not defined.

$$S = \frac{a - ar^n}{1 - r}$$
