Date: _____

Trig Final (Practice v35)

- You can use a calculator (like [Desmos](#))
- You should have a unit-circle with special angles and coordinates marked.

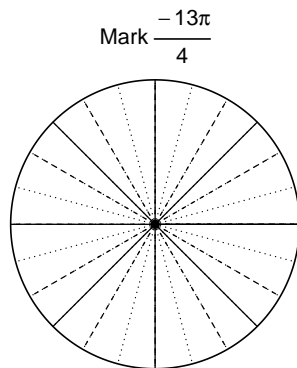

Question 1

In the figure below, we see a circle and a central angle that subtends an arc. The angle measure is 2.5 radians. The radius is 2.7 meters. How long is the arc in meters?

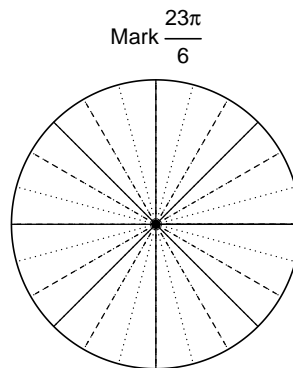

Question 2

Consider angles $-\frac{13\pi}{4}$ and $\frac{23\pi}{6}$. For each angle, use a spiral with an arrow head to **mark** the angle on a circle below in standard position. Then, find **exact** expressions for $\sin\left(-\frac{13\pi}{4}\right)$ and $\cos\left(\frac{23\pi}{6}\right)$ by using a unit circle (provided separately).

Find $\sin(-13\pi/4)$

Find $\cos(23\pi/6)$

Question 3

If $\tan(\theta) = \frac{-24}{7}$, and θ is in quadrant IV, determine an exact value for $\cos(\theta)$.

Question 4

A mass-spring system oscillates vertically with a midline at $y = 4.11$ meters, a frequency of 6.21 Hz, and an amplitude of 2.6 meters. At $t = 0$, the mass is at the minimum height. Write an equation to model the height (y in meters) as a function of time (t in seconds).
