Polynomial Operations EXAM (version 123)

1. Let polynomials $p(x)$ and $q(x)$ be defined below.

$$p(x) = -3x^5 + 10x^4 + 2x^3 - 6x + 9$$

$$q(x) = -5x^5 - 3x^4 - 9x^3 + x^2 - 7$$

Express the difference $p(x) - q(x)$ in standard form.

2. Let polynomials $a(x)$ and $b(x)$ be defined below.

$$a(x) = -8x^2 - 3x - 6$$

$$b(x) = -3x + 8$$

Express the product $a(x) \cdot b(x)$ in standard form.

3. Express $(x + 1)^4$ in standard (expanded) form.

Polynomial Operations EXAM (version 123)

4. Let polynomials $f(x)$ and $g(x)$ be defined below.

$$\begin{aligned}f(x) &= 4x^3 - 28x^2 - 29x - 18 \\g(x) &= x - 8\end{aligned}$$

The quotient of $\frac{f(x)}{g(x)}$ can be expressed as a polynomial, $h(x)$, and a remainder, R (a real number).

$$\frac{f(x)}{g(x)} = h(x) + \frac{R}{x - 8}$$

By using synthetic division or long division, express $h(x)$ in standard form, and find the remainder R .

5. Let polynomial $f(x)$ still be defined as $f(x) = 4x^3 - 28x^2 - 29x - 18$. Evaluate $f(8)$.
