Date: _____

Trig Final (TEST v663)

- You can use a calculator (like [Desmos](#))
- You should have a unit-circle with special angles and coordinates marked.

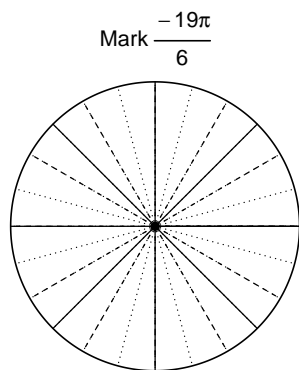

Question 1

In the figure below, we see a circle and a central angle that subtends an arc. The angle measure is 2.3 radians. The arc length is 23 meters. How long is the radius in meters?

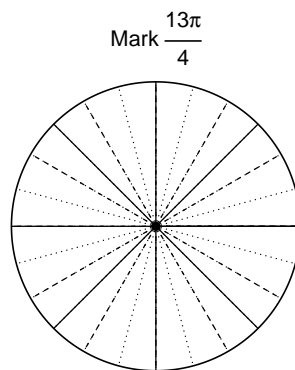

Question 2

Consider angles $-\frac{19\pi}{6}$ and $\frac{13\pi}{4}$. For each angle, use a spiral with an arrow head to **mark** the angle on a circle below in standard position. Then, find **exact** expressions for $\sin\left(-\frac{19\pi}{6}\right)$ and $\cos\left(\frac{13\pi}{4}\right)$ by using a unit circle (provided separately).

Find $\sin(-19\pi/6)$

Find $\cos(13\pi/4)$

Question 3

If $\sin(\theta) = \frac{-35}{37}$, and θ is in quadrant IV, determine an exact value for $\tan(\theta)$.

Question 4

A mass-spring system oscillates vertically with an amplitude of 5.43 meters, a frequency of 6.71 Hz, and a midline at $y = 2.42$ meters. At $t = 0$, the mass is at the minimum height. Write an equation to model the height (y in meters) as a function of time (t in seconds).
